## Overview

This service provides revenue data and empowers Methoders to fetch the data without needing to create tickets or run special tools.

The ultimate goal of this service will be to be the source of truth for all revenue breakdowns, outside of QuickBooks. This will help us:

- Use data in the financial model to better understand the source of revenue and forecast better.
- Get real-time financial data without needing to request it from Saudia.
- Provide the data used by the CSM and PS teams in daily operations.

## Service / RESTful endpoint

### How to generate raw data via the browser / RESTful endpoint

You can get the data by modifying the following endpoint according to the parameters you desire:

<https://internal1.methodintegration.com/SaaSAnalyticsSrv/api/getinvoices>

#### Parameters

1. **API\_Token**  
Use cd4cd0b9-a382-408c-8c52-07a4ecba511d for now
2. **FromDateUTC**  
The beginning (and including) date of the date range you want to include, in UTC time. For example, getting the values for all of April, 2017 (Eastern Time) would have a FromDateUTC of "2017-04-01T04:00".
3. **ToDateUTC**  
The ending (and excluding) date of the date range you want to include, in UTC time. For example, getting the values for all of April, 2017 (Eastern Time) would have a ToDateUTC of "2017-05-01T04:00".
4. **ReturnTransactionLines**
  - a. Values: true or false (true is not supported for CSV format)
  - b. Meaning: do you want to include the line items of the invoice? Caution: this will make the JSON returned to be very large.
5. **ReturnAccounts**

- a. Values: true or false (if using CSV format, only Invoices or Accounts can be returned, if using JSON format, both Invoices and Accounts can be returned at the same time)
- b. Meaning: do you want to return revenue grouped by the accounts active in that period?

#### 6. ReturnInvoices

- a. Values: true or false (if using CSV format, only Invoices or Accounts can be returned, if using JSON format, both Invoices and Accounts can be returned at the same time)
- b. Meaning: do you want to return revenue grouped by the invoices in that period?

#### 7. Format

- a. Values: json (default) or CSV
- b. Recommendation: json if you are going to use in a coded solution, CSV if you are going to open in Excel or Docs.

#### Example

[https://internal1.methodintegration.com/SaaSAnalyticsSrv/api/getinvoices?API\\_Token=cd4cd0b9-a382-408c-8c52-07a4ecba511d&FromDateUTC=2017-04-01T04:00&ToDateUTC=2017-05-01T04:00&ReturnTransactionLines=false&ReturnAccounts=false&ReturnInvoices=true&format=json](https://internal1.methodintegration.com/SaaSAnalyticsSrv/api/getinvoices?API_Token=cd4cd0b9-a382-408c-8c52-07a4ecba511d&FromDateUTC=2017-04-01T04:00&ToDateUTC=2017-05-01T04:00&ReturnTransactionLines=false&ReturnAccounts=false&ReturnInvoices=true&format=json)

### How to generate Excel file from the browser / RESTful endpoint

As an alternative to using the SaaS Analytics app, you can now generate an Excel file from an endpoint!

<https://internal1.methodintegration.com/SaaSAnalyticsSrv/api/getinvoicestoexcel>

#### Parameters

1. **API\_Token**  
Use cd4cd0b9-a382-408c-8c52-07a4ecba511d for now
2. **FromDateUTC**  
The beginning (and including) date of the date range you want to include, in UTC time. For example, getting the values for all of April, 2017 (Eastern Time) would have a FromDateUTC of "2017-04-01T04:00".
3. **ToDateUTC**  
The ending (and excluding) date of the date range you want to include, in UTC time. For example, getting the values for all of April, 2017 (Eastern Time) would have a ToDateUTC of "2017-05-01T04:00".
4. **ReturnTransactionLines**
  - a. Values: true or false
  - b. Meaning: do you want to include the line items of the invoice?
  - c. Caution - if you don't need the invoices, don't use it, as it slows down the report by a second or two.
5. **ReturnAccounts**
  - a. Values: true or false

- b. Meaning: do you want to return revenue grouped by the accounts active in that period?

#### 6. ReturnInvoices

- a. Values: true or false
- b. Meaning: do you want to return revenue grouped by the invoices in that period?
- c. Caution - if you don't need the invoices, don't use it, as it slows down the report by a second or two.

#### 7. ReturnAttributionData

- a. Values: true or false
- b. Meaning: returns the related marketing attribution results for the accounts included in the report.
- c. WARNING! This will really slow down the request, up to 1 minute, as it has to be a call to the [Attribution Service JSON call](#). This is slow, so be careful. Did I mention it is slow?

#### 8. SplitByMonth

- a. Values: true or false
- b. Meaning: For a period that spans over two to twelve months, the Accounts tab will have one row per account per month. Revenue will then be associated to the appropriate month. This allows you to build a pivot table to analyse changes over time.
- c. WARNING! Do not include more than 12 months.

### Example

Feb-2020 (PROD - **returns attribution data**)

`https://internal1.methodintegration.com/SaaSAnalyticsSrv/api/getinvoicestoexcel?API_Token=cd4cd0b9-a382-408c-8c52-07a4ecba511d&FromDateUTC=2020-01-01T04:00&ToDateUTC=2020-02-01T04:00&ReturnTransactionLines=false&ReturnAccounts=true&ReturnInvoices=true&ReturnAttributionData=true&SplitByMonth=false`

Sep-2021 to Aug-2022 (PROD - for monthly LTR data analysis)

## Tabs and Questions

### AccountsSummary Tab

Question: Where does our revenue come from, by cohort, and by platform?

### AccountsSummary vs AccountsSummary (New) Tab

As of Sep 26, 2023 note the following:

1. AccountsSummary includes conversion exceptions in "Total Paying Customers Lost", whereas AccountsSummary (New) does not include them in "Total Paying Customers Lost", but does include them in cohorts. *Needs to be cleaned up.*
2. AccountsSummary only includes MONTHLY customers in cohorts, whereas AccountsSummary (New) also includes PREPAY customers. So, this accounts for the discrepancy in Lost Count and Retained Count. *Needs to be cleaned up.*
3. RevCogs uses AccountSummary for legacy reasons, so RevCogs won't match AccountsSummary (New) for the same period, for this reason.

Also, past cleanups:

- September 2023 - Changed RevCogs: updated the following lines to include new accounts and new cancelled accounts in churn calcs, as of September 2023.
  - Paying customers at BOM
  - Total Paying Customers Lost (less exceptions)
  - Churn rate all denominator
- Note, as part of this fix, churn % calculations baked into RevCogs prior to September 2023 will not match the output of fresh AccountsSummary tabs.

## PrepPaySummary Tab

Question: What impact on cash did the current month have, so that we can forecast availability for F/X conversion?

## Current SaaS Tab

Current SaaS amount of apps and users inside each account. Used for monthly forecasting, since it gives us a better idea of what the upcoming month has in store, rather than waiting until invoices go through. Found nightly using Customer Data Miner. Caveats: (a) Prepay discount is estimate, not precise, (b) Classic Legacy Stepped pricing (only a few accounts have this), (c) no allowance for extras like portals, email overage, storage overage.

## Segments Tab

- Segments is a pivot table of the data in Accounts.
- You will have to refresh the pivot table (PivotTable Analyze > Refresh).
- Typically copied into [Marketing KPI Tracker](#) so that we can get churn, saas revenue, LTR and acquisition by target (vertical, sync type, sync region)

## What do all the fields in the Accounts tab mean?

- BOMCustomerGrouping - At the beginning of the reporting period, were they classified as "Trialer", "Customer", or "Lost".
- EOMCustomerGrouping - At the beginning of the reporting period, were they classified as "Customer", or "Lost".
- AgeAtBOM - At the beginning of the reporting period, how many days has it been since they first started the trial of this account.
- SaaSIncomeAmount - portion of the invoices in the reporting period that is SaaS revenue
- SaaSExpense - portion of the SaaS invoices in the reporting period that is a discount
- SaaSInvoiceCount - count of invoices in the reporting period that have SaaS revenue
- PSIncomeAmount - portion of the invoices in the reporting period that is PS revenue
- PSExpenseAmount - portion of the PS invoices in the reporting period that is a discount
- LiabilityPortion - portion of the SaaS invoices in the reporting period that added/deducted to/from their prepay balance
- FirstSaaSInvoiceTxnDate - the date of their first saas invoice
- IsNewPayer - did they pay for the first time in the reporting period
- Att fields are marketing attribution fields
- CustDat fields refer to the latest definitions here:

[AlocetSystem.CustomerMethodAccount Fields/Columns \(Company Accounts\)](#)

## Operating

### Updating the financial model

1. Copy and paste the grey-colored background cells in column B of the AccountSummary tab to the RevCogs month starting in row 7 "*Made their first payment*".
2. Copy and paste the grey-colored background cells from PrepaySummary into the RevCogs month starting in row 88 "*Prepay Contracts (cash in)*". Note: you will need to have included Invoices in your data fetch for this to show up.
3. Update the actual F/X gain in row 94 "*Other - Exchange Gain (Loss)*".
4. Update all completed cells to grey, matching past months.

### What's happening behind the scenes

1. All invoices in AlocetSystem with a TxnDate in the date range specified are pulled.
2. All line items for the invoices are categorized as SaaS, PS, and other.
3. All invoices are categorized based on the categorization of the line items, and the account age and type.
4. If you had ReturnAccounts=true, all accounts who were active at some point in the date range are pulled, and the invoices totalled up per account.
5. If you have the format=CSV, it produces a CSV file and returns it to you, via a browser download.

## Technical Notes

### Executable

Repo:

Project/Solution: MethodSaaSAnalytics.vbproj / MethodSaaSAnalytics.sln

### Service

Repo:

Project/Solution: SaasAnalyticsSrv.csproj / SaasAnalyticsSrv.sln

Controller: GetInvoicesController.cs

## How to generate Net/Gross MRR/NRR Churn (Excel file)

As an alternative to using the SaaS Analytics app, you can now generate an Excel file from an endpoint!

<https://internal1.methodintegration.com/SaaSAnalyticsSrv/api/GetPeriodComparisonToExcel>

### Parameters

1. **API\_Token**  
Use cd4cd0b9-a382-408c-8c52-07a4ecba511d for now
2. **Period1StartUTC**  
The beginning (and including) date of the 1st period you want to include, in UTC

time. For example, getting the values for all of April, 2017 (Eastern Time) would have a Period1StartUTC of "2017-04-01T04:00".

3. **Period1EndUTC**

The ending (and excluding) date of the 1st period you want to include, in UTC time.

4. **Period2StartUTC**

The beginning (and including) date of the 2nd period you want to include, in UTC time. For example, getting the values for all of April, 2017 (Eastern Time) would have a Period1StartUTC of "2017-04-01T04:00".

5. **Period2EndUTC**

The ending (and excluding) date of the 2nd period you want to include, in UTC time.

## Example

MONTHLY - Jan 2023: From Dec-2022 → Jan-2023 changes (PROD)

### **What's happening behind the scenes**

1. All invoices and credit memos for the 1st period are pulled.
2. All invoices and credit memos for the 2nd period are pulled.
3. The two periods are merged and totalled per all accounts represented in those two periods.

4. Columns are added for formula calculations to depict whether the change in SaaS is due to cancellation, expanding/upgrading, contracting/downgrading or cancellation.
5. The “NRR by Customer” provides the calculations needed to calculate NRR. If you want to see it by account, you can use the values from “NRR by Account” - however viewing NRR by Customer is more accurate, since it handles customers who close one account in order to switch to a new account.

## Technical Notes

### Executable

Repo:

Project/Solution: MethodSaaSAnalytics.vbproj / MethodSaaSAnalytics.sln

### Service

Repo:

Project/Solution: SaaSAnalyticsSrv.csproj / SaaSAnalyticsSrv.sln

Controller: GetPeriodComparisonToExcelController.cs

## How to merge entities in ALOCETSYSTEM

This has specialized business logic to handle our own validations, and is a wrapper around the core generic merge endpoint functions

<https://internal1.methodintegration.com/SaaSAnalyticsSrv/api/MergeAlocet>

### Parameters

1. **API\_Token**  
Use cd4cd0b9-a382-408c-8c52-07a4ecba511d for now
2. **CompanyAccount**
3. **FromID**  
The RecordID of the Entity (i.e. customer) you are merging FROM, i.e. the one that will be deleted after the merge.
4. **ToID**  
The RecordID of the Entity (i.e. customer) you are merging TO, i.e. the one that will be kept after the merge.
5. **MergeFields**
  - d. Values: true or false
  - e. Meaning: do you want to insert values from fields in the FROM record into the TO record if those fields in the TO record are empty? For example, if the TO had an empty phone number, but the phone number was not empty in the FROM, would you want the TO to get that phone number?
6. **MergeTags**
  - a. Values: true or false
  - b. Meaning: do you want to mash up the tags with the FROM and TO?  
Duplicates are ignored. For example, if the TO had “yellow,blue” tags, and the

FROM had a "blue,orange" tag, these would be merged into "yellow,blue,orange" in the TO record.

## 7. UserID

The RecordID of the user in AlocetSystem making these changes (for the audit trail)

### Example

[https://internal1.methodintegration.com/saasanalyticssrv/api/MergeAlocet?API\\_Token=cd4cd0b9-a382-408c-8c52-07a4ecba511d&CompanyAccount=AlocetSystem&FromID=-1&ToID=-1&MergeFields=true&MergeTags=true&UserID=1](https://internal1.methodintegration.com/saasanalyticssrv/api/MergeAlocet?API_Token=cd4cd0b9-a382-408c-8c52-07a4ecba511d&CompanyAccount=AlocetSystem&FromID=-1&ToID=-1&MergeFields=true&MergeTags=true&UserID=1)

### What's happening behind the scenes

1. Validation.
  - a. Does not allow customer who has credit card information to be merged into someone who does not have credit card information (loss of ability to charge them).
  - b. Does not allow customers who both have payment information and the payment information is different (this could be on purpose by the customer).
  - c. Does not allow someone without payment information to be merged into someone who does have payment information but for an inactive account (this could be an accidental charge).
  - d. Cannot merge from a partner. This could cause a loss of partner specific information.
2. Calls general entity merge.

## How to call Daily Sales Delta Report in ALOCETSYSTEM

Calls the Sales Delta report that normally goes off at midnight

<https://internal1.methodintegration.com/SaaSAnalyticsSrv/api/KPI>

### Parameters

1. **API\_Token**  
Use cd4cd0b9-a382-408c-8c52-07a4ecba511d for now
2. **Type** - dailydelta

3. **TargetFromDate**
4. **TargetToDate**
5. **User** - the user name of the person running this in AlocetSystem
6. **emailto**
  - Who will receive the email output.
  - Leave blank to receive no email.

### Example

[https://internal1.methodintegration.com/SaaSAnalyticsSrv/api/KPI?API\\_Token=cd4cd0b9-a382-408c-8c52-07a4ecba511d&type=dailydelta&TargetFromDate=2019-02-01&TargetToDate=2019-02-28&User=Paul Jackson&emailto=paul@method.me](https://internal1.methodintegration.com/SaaSAnalyticsSrv/api/KPI?API_Token=cd4cd0b9-a382-408c-8c52-07a4ecba511d&type=dailydelta&TargetFromDate=2019-02-01&TargetToDate=2019-02-28&User=Paul Jackson&emailto=paul@method.me)

### What's happening behind the scenes

1. Validation.
  - a. Makes sure User is not empty.
2. Calls udsp\_sales\_marketing\_delta

### Technical Notes

#### Executable

## How to call Daily Sales KPI Report in ALOCETSYSTEM

Calls the Sales Delta report that normally goes off at midnight

<https://internal1.methodintegration.com/SaaSAnalyticsSrv/api/KPI>

### Parameters

1. **API\_Token**
  - Use cd4cd0b9-a382-408c-8c52-07a4ecba511d for now
2. **Type** - dailysalesKPI
3. **dateUTC** - the date, in UTC time you are targetting
4. **User** - the user name of the person running this in AlocetSystem
5. **emailto**
  - Who will receive the email output.
  - Leave blank to receive no email.
6. **emailCC**
  - Who will be CC'd

- Required

## Example

[https://internal1.methodintegration.com/SaaSAnalyticsSrv/api/KPI?API\\_Token=cd4cd0b9-a382-408c-8c52-07a4ecba511d&type=dailysalesKPI&DateUTC=2019-02-26%2012:00PM&User=Paul%20Jackson&emailto=paul@method.me&emailCC=paul+CC@method.me](https://internal1.methodintegration.com/SaaSAnalyticsSrv/api/KPI?API_Token=cd4cd0b9-a382-408c-8c52-07a4ecba511d&type=dailysalesKPI&DateUTC=2019-02-26%2012:00PM&User=Paul%20Jackson&emailto=paul@method.me&emailCC=paul+CC@method.me)

## What's happening behind the scenes

1. Validation.
  - a. Makes sure User is not empty.
2. Calls `udsp_sales_marketing_kpi_values`

## Technical Notes

### Executable

Project/Solution: SaaSAnalyticsSrv.csproj / SaaSAnalyticsSrv.sln

Controller: KPIController.cs

## Endpoint to send to BigQuery

[http://localhost:19389/api/revtobigquery?API\\_Token=cd4cd0b9-a382-408c-8c52-07a4ecba511d&FromTimeModifiedUTC=2026-02-01T14:00](http://localhost:19389/api/revtobigquery?API_Token=cd4cd0b9-a382-408c-8c52-07a4ecba511d&FromTimeModifiedUTC=2026-02-01T14:00)

As an alternative to using the SaaS Analytics app, you can now generate an Excel file from an endpoint!

<https://internal1.methodintegration.com/SaaSAnalyticsSrv/api/revtobigquery>

## Parameters

1. **API\_Token**  
Use `cd4cd0b9-a382-408c-8c52-07a4ecba511d` for now
2. **FromTimeModifiedUTC**  
Fetch records that have been modified after this date, in UTC time. For example, getting the values for all of April, 2021 (Eastern Time) would have a `FromTimeModifiedUTC` of `"2021-04-01T04:00"`.

## Example - modified after Nov 28, 2024

[https://internal1.methodintegration.com/SaaSAnalyticsSrv/api/revtobigquery?API\\_Token=cd4cd0b9-a382-408c-8c52-07a4ecba511d&FromTimeModifiedUTC=2024-11-28T14:00](https://internal1.methodintegration.com/SaaSAnalyticsSrv/api/revtobigquery?API_Token=cd4cd0b9-a382-408c-8c52-07a4ecba511d&FromTimeModifiedUTC=2024-11-28T14:00)

## What's happening behind the scenes

1. Merging.
  - a. Looks for any records in the following tables that has changed:
    - i. accEntity
    - ii. accltem
    - iii. acclInvoice
    - iv. accCreditMemo
    - v. CustomerMethodAccount
  - b. Validates the DWchecksum value for each of those changes to see if it is different from last time we sent the record to BigQuery.
  - c. For all the changed or new records a connection is made to BigQuery and merged into the Entity, Item, Trans, and Account tables (respectively).
  - d. DWchecksum is updated for the changed/new records.

## Technical Notes

- Don't run twice at the same time. This could cause a race condition. This is part of a nightly process, so really don't need to run this more than once a day anyway.
- Will only process 15,000 records per table at any one time to prevent a memory overload. This should never be an issue since it is only updating records that were modified since yesterday.
- For more information about how this is used, as well as the field definitions, see:  
<https://docs.google.com/document/d/1j5cU6nPRhjCcykpM4rDL05ENeCxaFzrRxkzE5un0GCQ/edit#heading=h.3mj9ncp15r>
